

Isotope Production Opportunities at H-Canyon

Allen Gunter
DOE-SR

Program Changes at SRS

- H-Canyon and HB-Line remain operational
- Base Cost covered by DOE-EM
 - Incremental costs for special missions
- H-Canyon capacity/capability underutilized
 - Available space and spare equipment
- HB-Line capacity/capability underutilized
 - Available space and spare equipment

SRS H-Area Facilities

- H-Canyon
 - Remote operations
 - Heavily shielded
 - Sand Filter ventilation
 - Highly flexible process operations
- HB-Line
 - Glovebox operations, three process lines
 - Phase I – Dissolving
 - Phase II – Neptunium/Plutonium Oxide Process
 - Phase III – Shielded Pu-238 Oxide Process
- Site Laboratories
- Integrated High Level Waste process

H-Canyon/HB-Line

H-Canyon Sections/Cells

HB-Line Structure

Typical HB-Line Glovebox

Past SRS Isotope Production

- thulium-170
- europium-152
- californium-252
- polonium-210
- special programs, other isotopes
- plutonium-242
- curium-244
- americium-243
- plutonium-238
- plutonium-240
- cobalt-60
- uranium-233
- tritium
- plutonium-239

Heavy Elements Stored At SRS

- **Plutonium (includes Pu-244)**
- **Americium**
- **Curium**
- **Californium**
- Uranium
- Thorium

Plutonium

- Pu – Weapons Grade to Fuel Grade –
 - Significant Inventory
 - Disposition Paths – MOX & WIPP
- Pu-244 – ~20 grams
 - Currently stored in 65 Mark 18A targets in L-Basin
- Pu-238 Mission Capable
 - Purification of scrap (similar to CASSINI mission)
 - Irradiated Np Target processing Pu-238 Recovery (“Frames” Process, picture follows)

Pu-238 "Frame" Process

H-Canyon Cell

Americium-241

- H Area facilities will be processing aged weapons-grade plutonium to provide as feed to Mixed Oxide Fuel Fabrication Facility beginning in 2012 ramping up to a production rate of 1MT/yr by 2015
- The waste stream will contain Am-241 which could be recovered
- Waste stream from preparing Pu is currently slated to be disposed in the SRS liquid waste system
- Could Increase the Am-241 throughput opportunity by processing higher isotopic fuel-grade Pu materials currently stored at SRS.
- Utilizes current process facility capability
 - Minor mods to HBL Phase II
 - Ion exchange and Pu oxide process
 - Restart of HBL-Phase III cabinets for Am-241
 - Shielded glovebox designed for Pu-238 oxide process
 - H-Canyon tank and transfer tank

Plutonium-244

- 65 Mark 18A's
 - Pu-242 targets for transplutonium isotopes
 - ~20 grams Pu-244 in ~300 grams Pu
 - Aluminum, Fission Products, Am, Cm, Cf
- Dissolve in H-Canyon
- Separate and Recover Pu-244 in H-Canyon
- Laboratory Pu oxide preparation

Americium, Curium, Californium

- Combination of elements/isotopes
 - Mark 18A residuals
 - Americium Oxide Target Slugs
 - Curium Oxide Target Slugs
 - Mark 51 (Americium/Curium Target
 - Cf sources
 - Am sources
- Remote recovery in H-Canyon via Ion Exchange with further purification/refinement elsewhere
- Challenge to covert solution to a suitable form for shipment
