

# Neutron Sciences at Oak Ridge National Laboratory

Presented to  
**Basic Energy Sciences  
Advisory Committee**

**Thomas E. Mason**  
Laboratory Director

**Robert J. McQueeney**  
Deputy Associate Laboratory Director  
for Neutron Sciences

Rockville, Maryland  
February 28, 2014

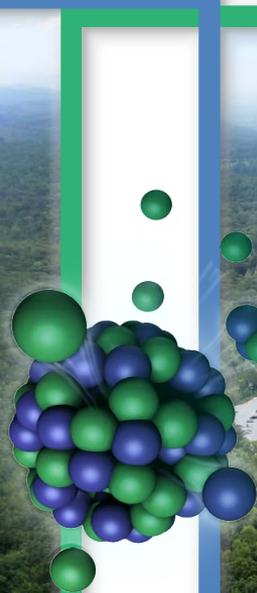

# BES investment has created 2 powerful neutron sources at ORNL

## High Flux Isotope Reactor (HFIR)

Intense steady-state neutron flux  
and a high-brightness cold neutron source

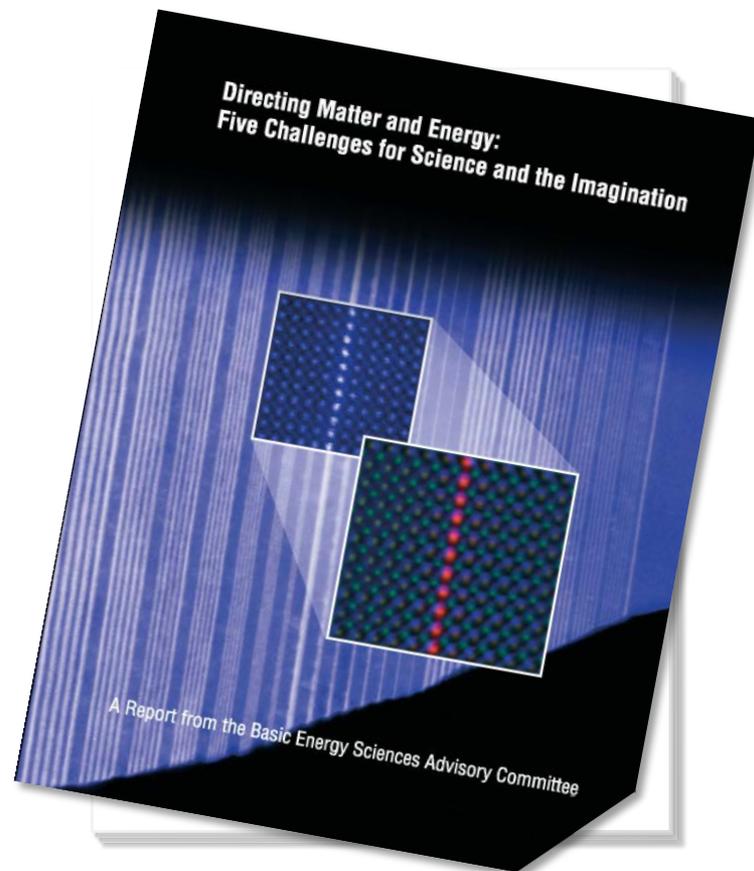

## Spallation Neutron Source (SNS)

World's most powerful  
accelerator-based neutron source

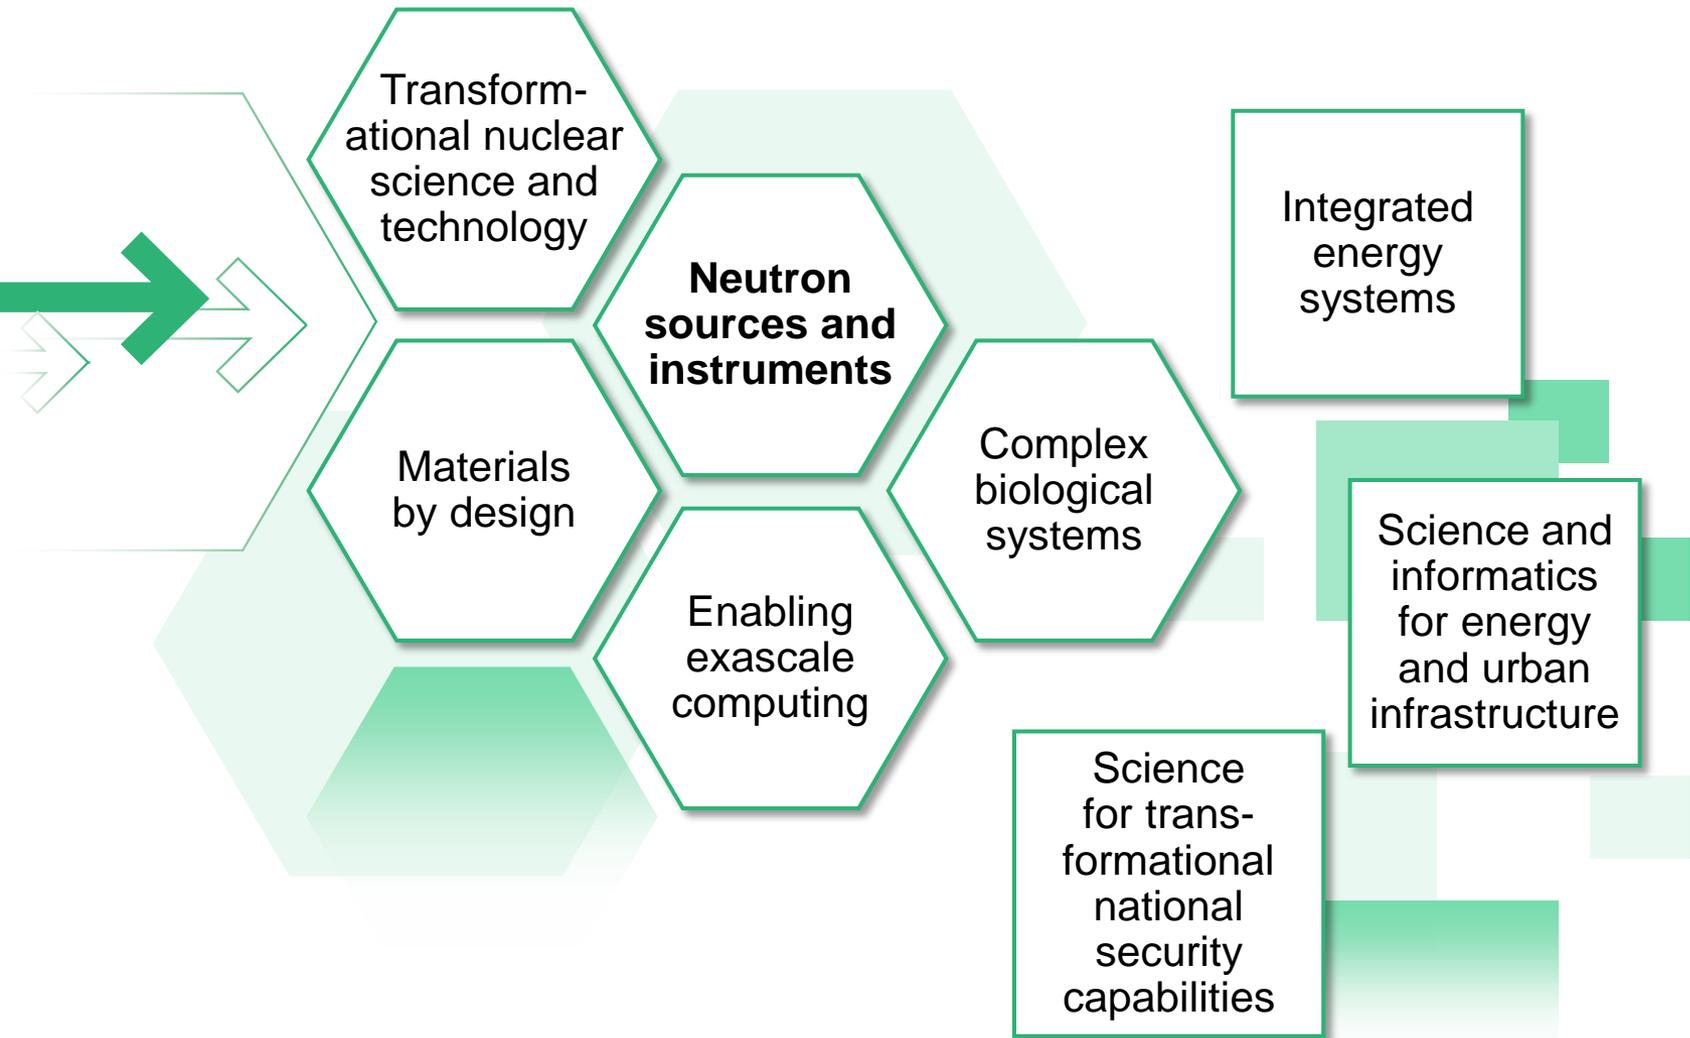

# Neutrons: An essential tool for addressing BESAC's grand challenges

- Controlling material processes at the level of electrons
- Designing and perfecting atom- and energy-efficient synthesis of revolutionary new forms of matter with tailored properties
- Understanding and controlling remarkable properties of matter that emerge from complex correlations of atomic or electronic constituents
- Mastering energy and information on the nanoscale to create new technologies with capabilities rivaling those of living things
- Characterizing and controlling matter very far away from equilibrium

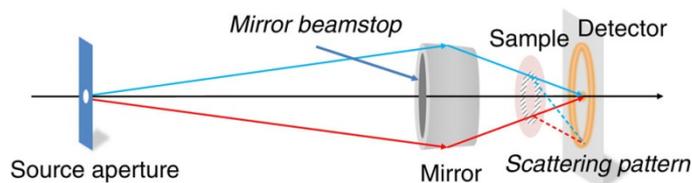

# We are investing to exploit and extend our neutron scattering capabilities

# Directed investments create new possibilities

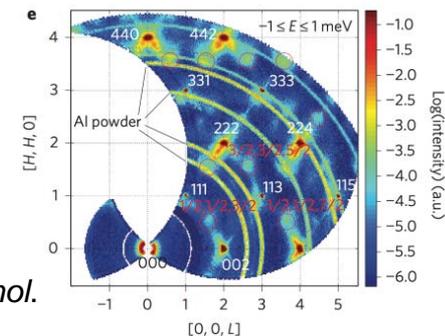

**Neutron sources and instrumentation:** Compact small-angle neutron scattering (SANS) instrument developed at MIT and tested at HFIR

D. Liu et al., *Nature Commun.* 4 (2013) 2555

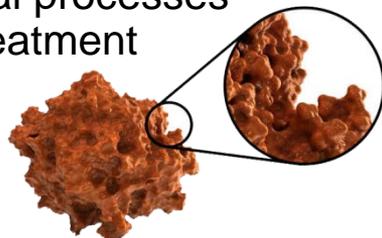

**Materials by design:** Inelastic neutron scattering measurements of phonon lifetimes expand understanding of thermal conductivity, opening the way to new processing routes that could improve key figures of merit for thermoelectrics

J. Ma et al., *Nature Nanotechnol.* 8, 445–451 (2013)

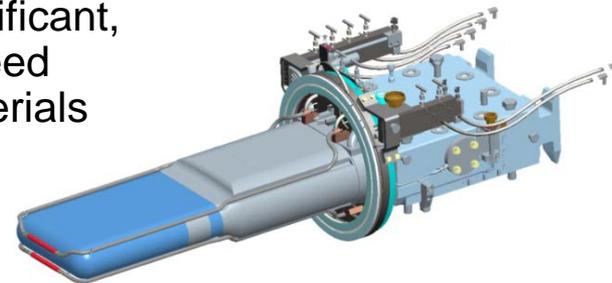

**Complex biological structures:**

By combining x-ray and neutron probes of structure with molecular dynamics simulations, fundamental processes in biomass during pretreatment are revealed, enabling new approaches to optimizing biomass conversion

Langan et al., *Green Chem.* 16, 63–68 (2014)

**Transformational nuclear science and engineering:** Proposed Fusion Materials Irradiation Test Stand at SNS has the potential to meet a significant, time-critical need for fusion materials damage data

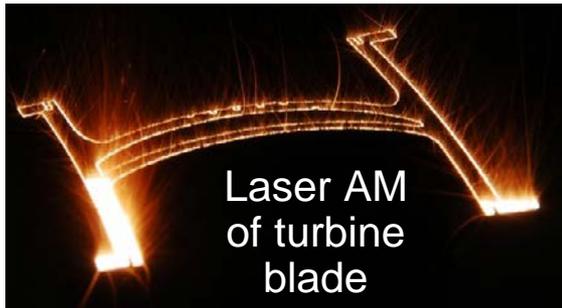

# Neutron imaging of turbine blades

## Supporting new energy-efficient manufacturing

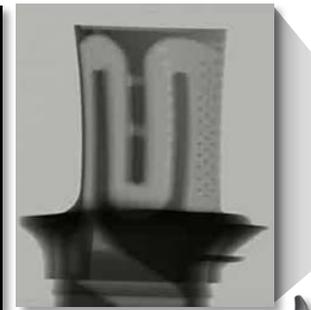

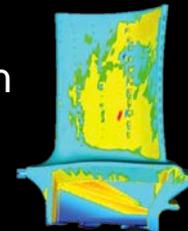

### Laser additive manufacturing (AM)

Enables low-cost manufacturing of turbines with optimized internal cooling structures

Creates large residual stress and other distortions

Profilometry map of distortion

ORNL and Morris Technologies are using neutron scattering and imaging to improve understanding of the link between residual stress distortions and laser AM processing

# Our vision: Continued US leadership in neutron scattering

## Science priorities

Defined through broad community engagement

- Quantum materials
- Materials synthesis and performance
- Biosciences
- Soft molecular matter

## Near-term focus

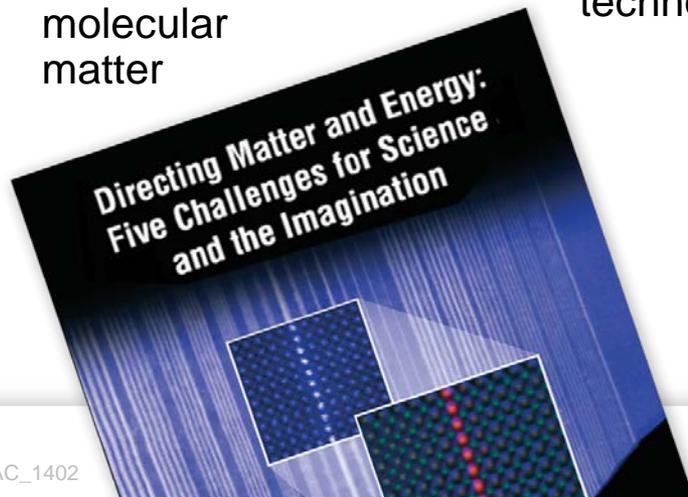

Make better use of available neutrons

- Improvements in efficiency
- Targeted development: Instruments and techniques
- Enabling technologies

## Long-term plan

Build a second target station at SNS to double neutron science capacity and expand capabilities

**Deliver new capabilities for directing energy and matter**

# SNS: World's most intense beams of pulsed neutrons for research

## Instruments

17 in operation,  
2 in construction/  
commissioning

## Operations

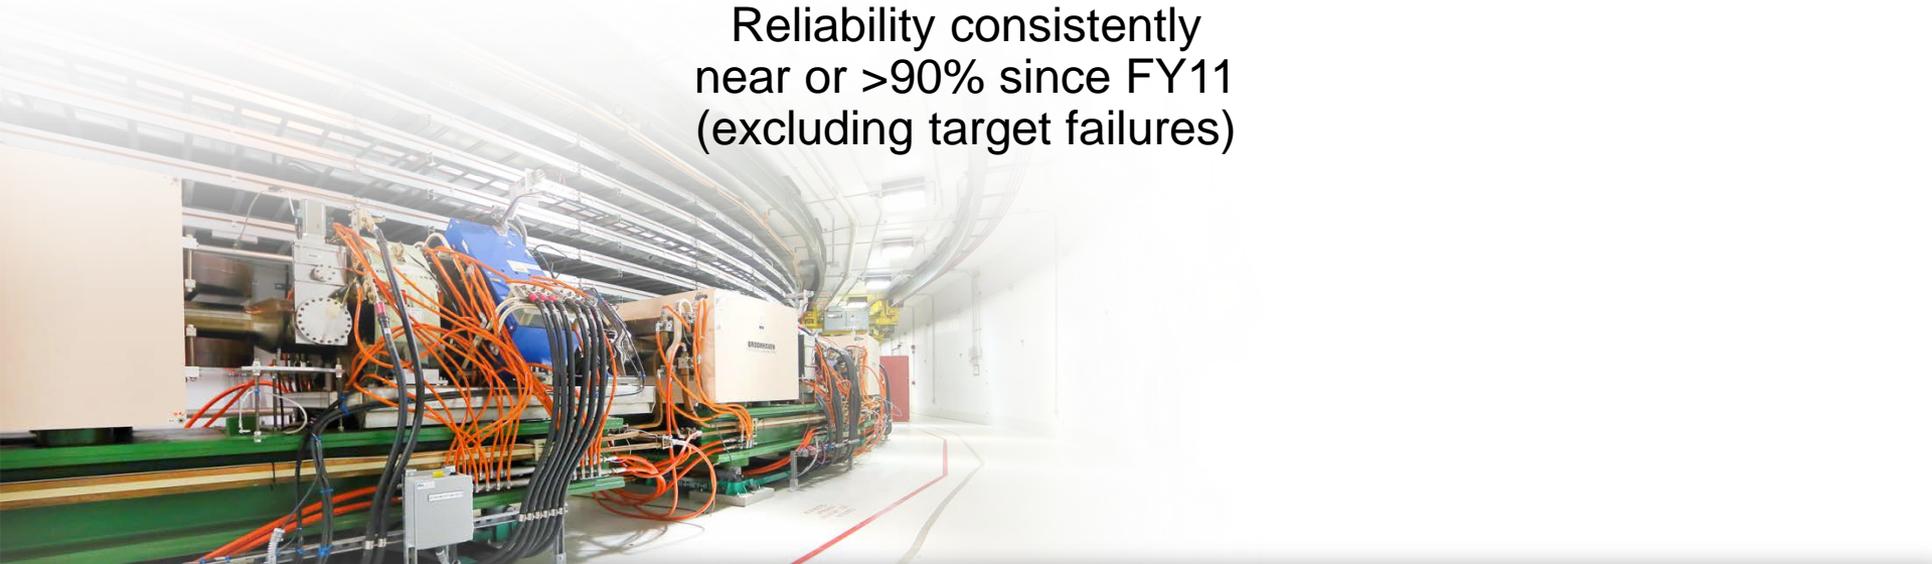

Routine operation  
at ~ 1.0 MW and 60 Hz;  
achieved 1.4 MW  
in September 2013

>5,000 hours/year  
scheduled for users

Reliability consistently  
near or >90% since FY11  
(excluding target failures)

## Targets

Recovery from CY12  
failures with enhanced  
QA, predictable  
fabrication, and new  
“jet flow” design

# HFIR: A reliable source for neutron scattering, isotopes, and materials

## Neutron scattering

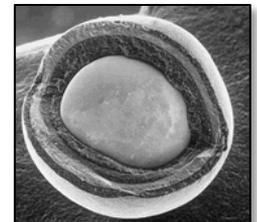

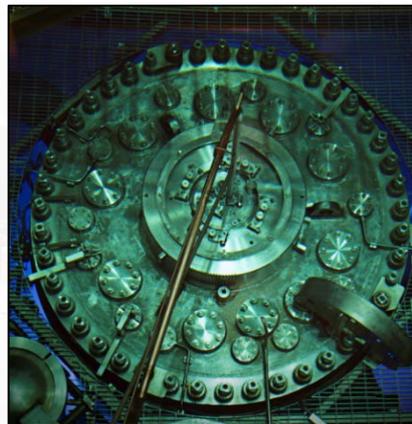

- Among the world's highest flux continuous sources
- 12 instruments in user program

## Reliability

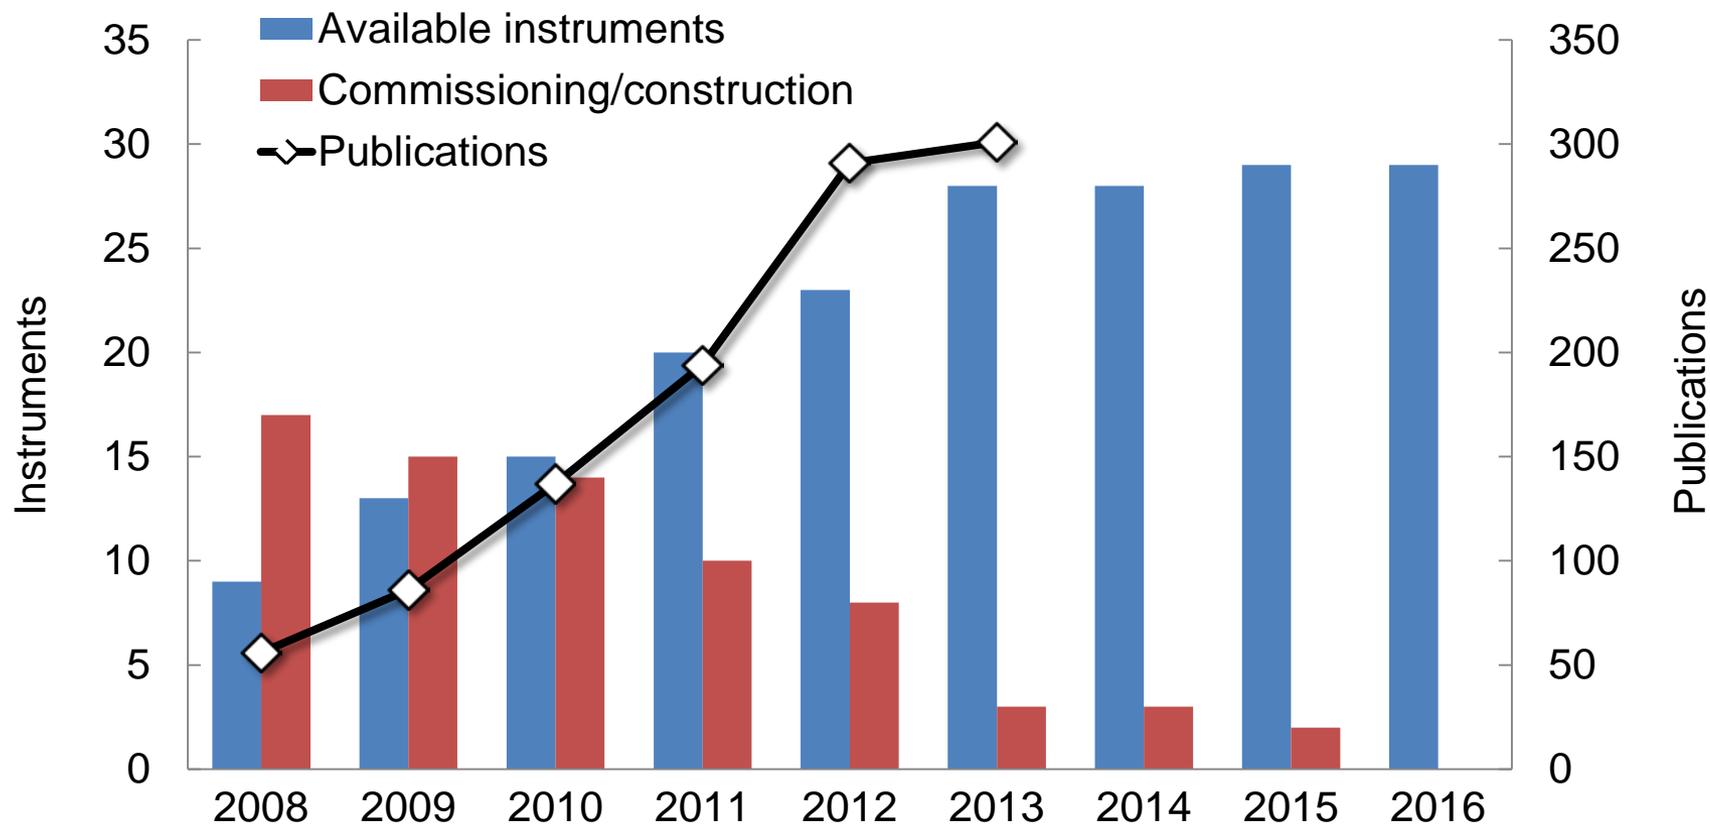

- FY13: 100% predictable; 6 fuel cycles
- ANS Meritorious Performance in Operations Award

## Isotopes and materials

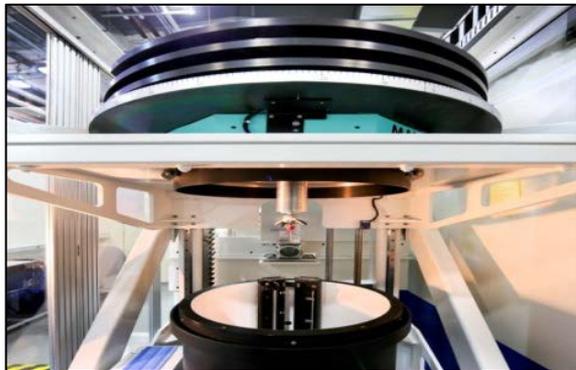

- Isotopes: Supplying 80% of world's Cf-252 (critical for industrial, defense, and energy uses); future source of Pu-238 to power NASA's deep space missions
- Materials: Exceptional resource for irradiation and neutron activation analysis

# Publications are increasing as instruments transition to user program

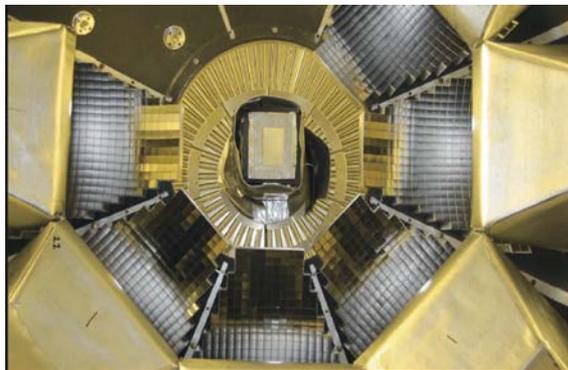

# FY13: New instruments, new capabilities, new communities

**IMAGINE (HFIR)**

Drug design, bioengineering  
small enzymes,  
pharmaceuticals,  
organic compounds

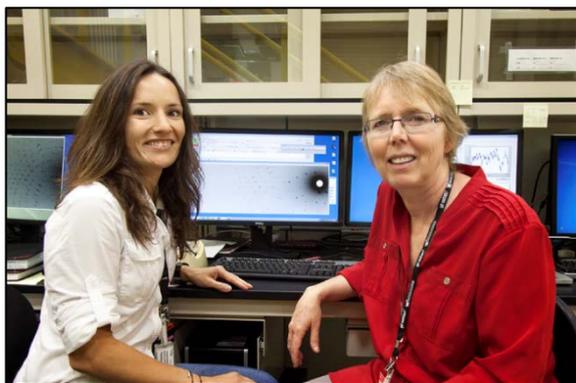

**VISION (SNS)**

Chemical spectroscopy,  
catalysis, H-bonded solids,  
optically inaccessible samples  
(e.g., catalytic packed beds)

**MaNDi (SNS)**

Drug design,  
bioengineering  
large enzymes,  
membrane proteins

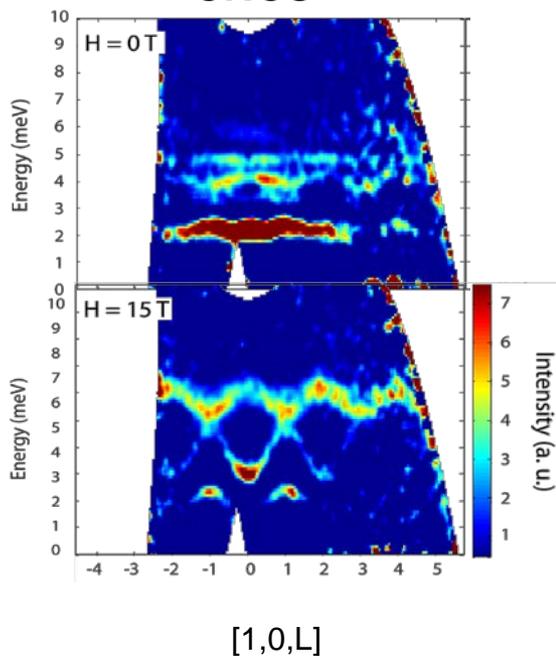

# Sample environments push neutron science to new physical regimes

## Magnetic fields

16 T continuous, 30 T pulsed

CNCS

Spin excitations in  $\text{Co}_3\text{V}_2\text{O}_8$ :  
2D transverse field Ising model

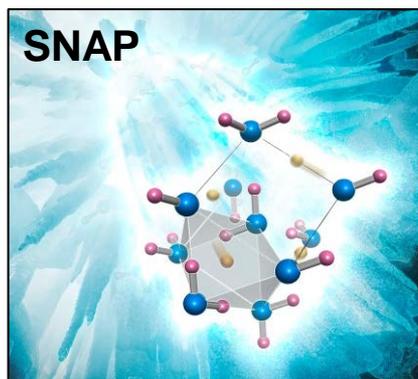

Gaulin et al. (in preparation)

## Pressure

97 GPa

Diamond anvil cell

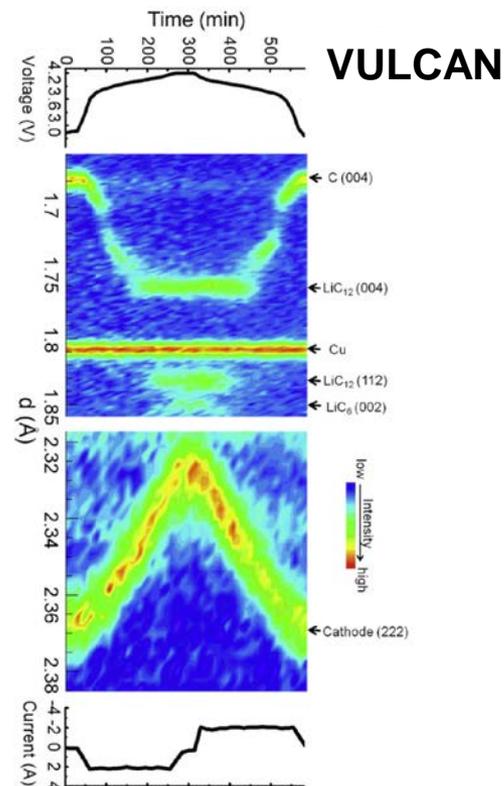

Proton delocalization in ice VII

Guthrie et al., *Proc. Natl. Acad. Sci.* (2013)

## In situ

H loading, stress, batteries

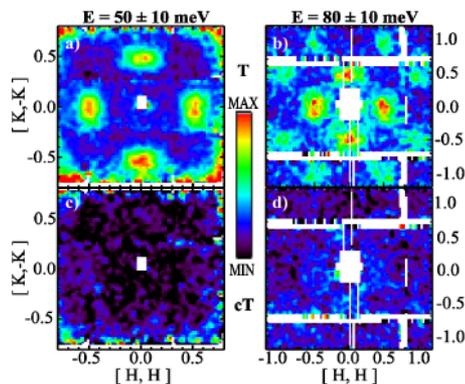

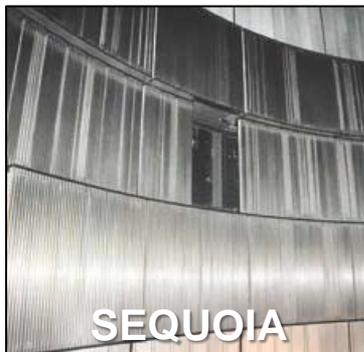

In situ diffraction on Li-excess  
layered compounds

Cai et al., *J. Power Sources* (2013)

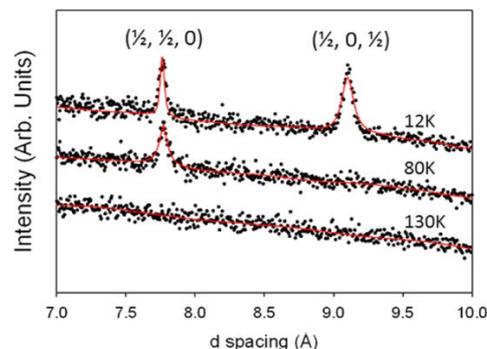

# Neutron detector technologies are delivering great science

## $^3\text{He}$ linear position-sensitive detectors

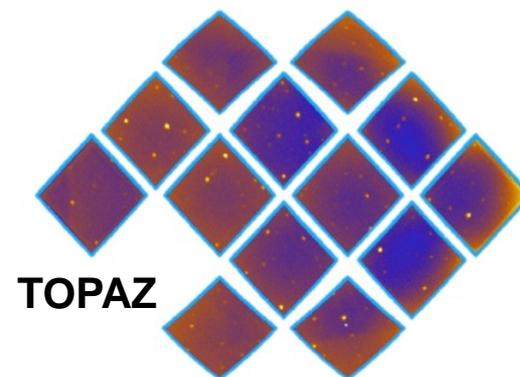

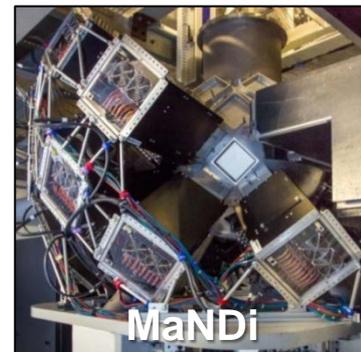

Nonsuperconducting cT phase:  
No observable magnetic signal  
Soh et al., *Phys. Rev. Lett.* (2013)

## Wavelength shifting fiber detectors

Independent ordering of 2 interpenetrating magnetic sublattices  
Morrow et al., *J. Am. Chem. Soc.* (2013)

## Anger cameras

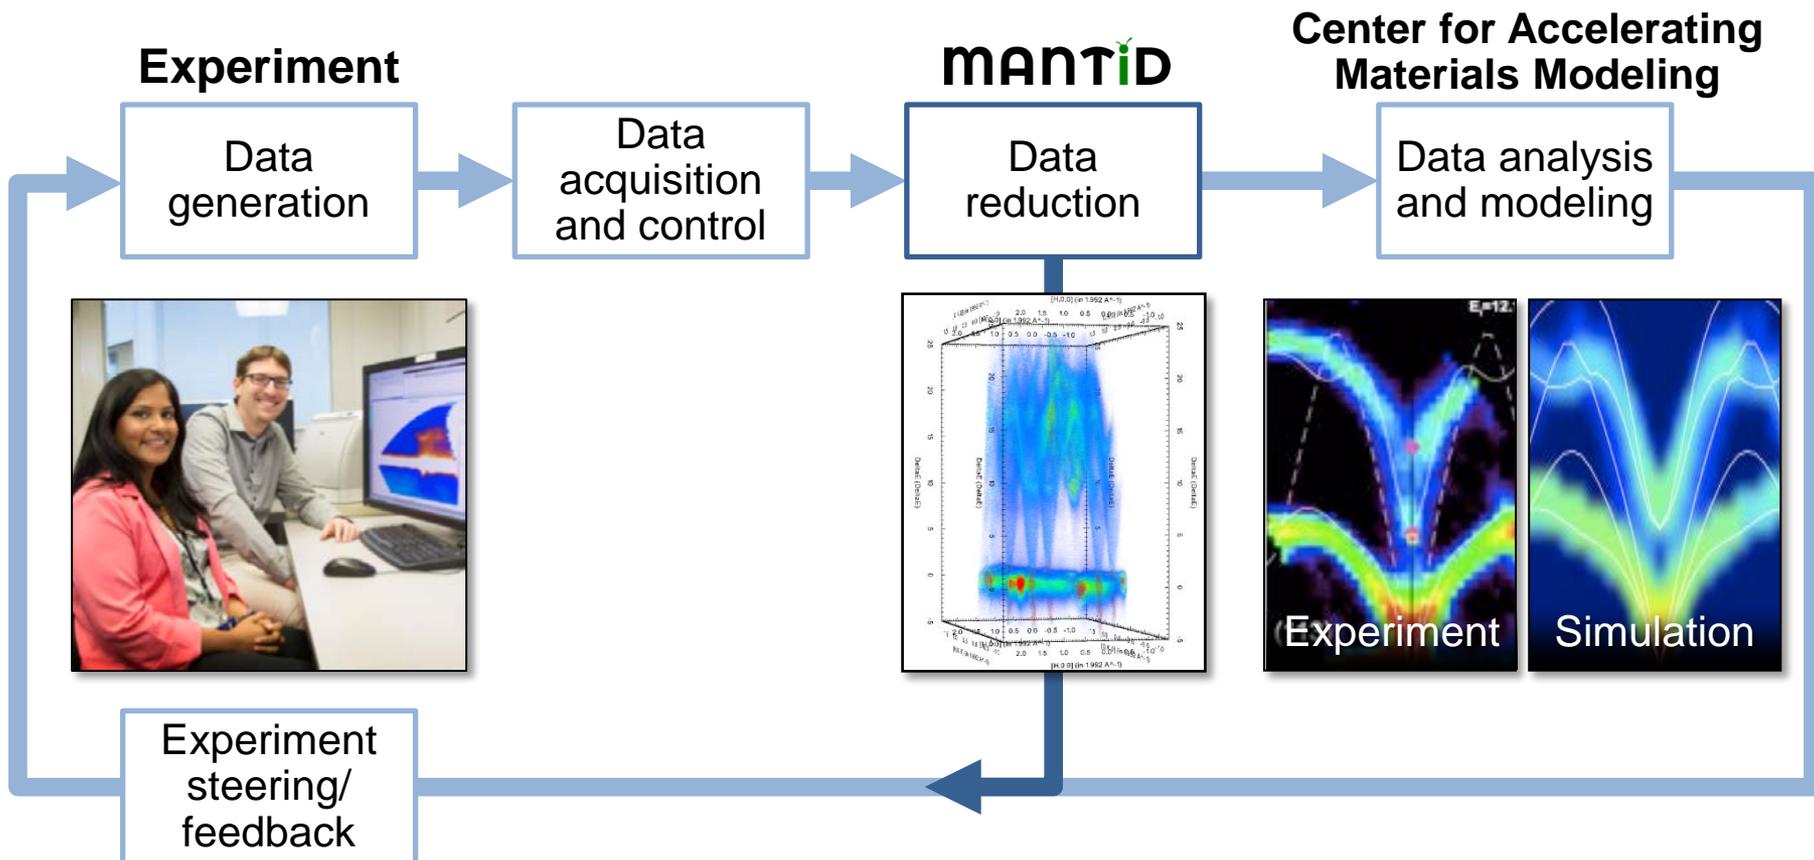

Exploring defects in Li battery materials  
Janssen et al., *Chem. Mater.* (2013)

# Moving data analysis, modeling and simulation closer to the experiment

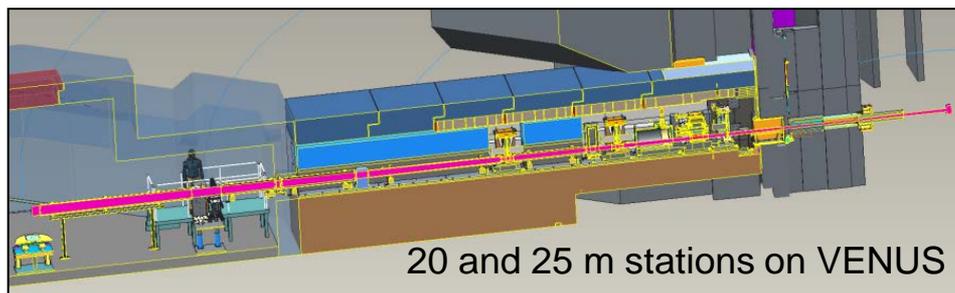

## Accelerating Data Acquisition, Reduction, and Analysis

# New instruments will add science capabilities in key areas

	High-throughput powder diffraction	VENUS: $\lambda$ -resolved neutron imaging	Cold triple-axis spectroscopy
Capabilities	<ul style="list-style-type: none"> <li>• Small samples (10 mg), complex sample environments</li> <li>• Rapid parametric studies</li> </ul>	<ul style="list-style-type: none"> <li>• Bragg-edge</li> <li>• Resonance absorption</li> <li>• <math>&lt;1 \mu\text{m}</math> resolution</li> </ul>	<ul style="list-style-type: none"> <li>• Polarized neutrons</li> <li>• Resonant spin echo (<math>\mu\text{eV}</math>)</li> <li>• Larmor diffraction (<math>\Delta d/d \sim 10^{-6}</math>)</li> </ul>
Applications	<ul style="list-style-type: none"> <li>• Materials discovery</li> <li>• In situ materials synthesis</li> <li>• Phase transformation kinetics</li> </ul>	<ul style="list-style-type: none"> <li>• Energy materials</li> <li>• Complex engineering structures</li> <li>• Geology, fracking</li> <li>• Plant physiology</li> <li>• Biology</li> </ul>	<ul style="list-style-type: none"> <li>• Quantum critical and correlated phenomena</li> <li>• Superconductivity</li> <li>• Electron-phonon coupling</li> <li>• Magneto-elastic coupling</li> </ul>

## Other concepts

- Neutron spin echo: Slow dynamics (ns– $\mu\text{s}$ ) of soft matter and magnetism
- Zeemans: Elastic and inelastic studies at high magnetic fields (40 T)

# We are consulting with the scientific community

## Quantum Materials

### Quantum Condensed Matter

Lawrence  
Berkeley National  
Laboratory  
December 2013  
Bob Birgeneau

## Biosciences

**Structural  
Biology, Bio-  
materials and  
Bioengineering**  
UC-San Diego  
January 2014  
Susan Taylor

## Materials Synthesis and Performance

**Energy  
Materials**  
Chicago  
Spring 2014  
George Crabtree

**Industry**  
Washington, D.C.  
Spring 2014  
(Chair TBD)

## Soft Molecular Matter

**Soft  
Matter**  
Santa Barbara  
May 2014  
Philip Pincus

# Quantum condensed matter: Moving into the mesoscale

## Goal: Understanding materials response on the mesoscale

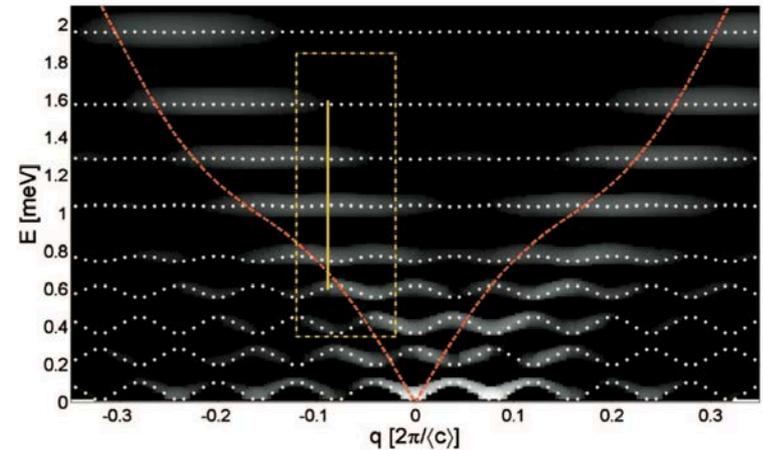

- Topological phases and excitations
- Dynamics in heterostructures/interfaces
- Quantum phases in extreme conditions

## Capabilities required

- Higher brightness at long wavelengths
- Access to smaller energy scales ( $< 1 \mu\text{eV}$ )
- High-field (40 T) and high-pressure (100 GPa) sample environments

Skyrmion lattice  
Milde et al., *Science* (2013)

Dy/Y multilayers  
Grunwald et al., *Phys. Rev. B* (2010)

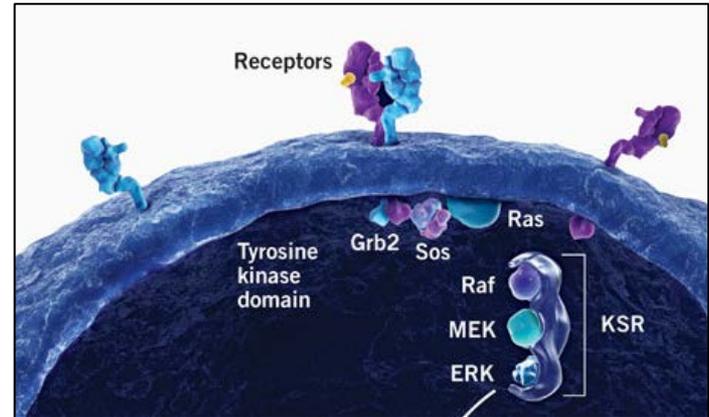

# Neutrons are ideal for exploring complex biological structures

## Goal: Predictive understanding built on multidisciplinary approaches

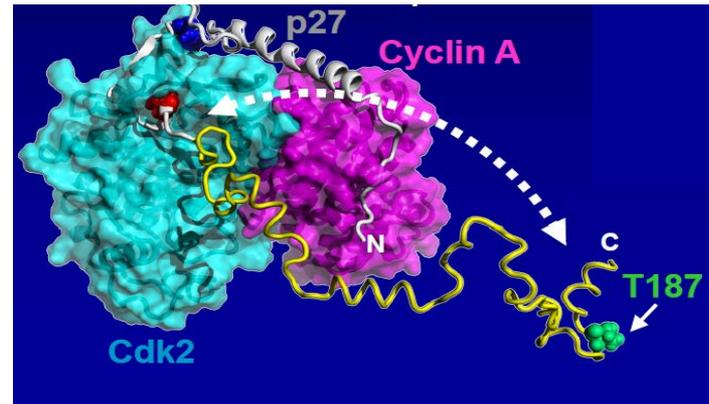

- Dynamic functional assemblies
- Disorder and flexibility
- Biological membranes and associated complexes

## Capabilities required:

- Higher brightness at long wavelengths
- Multiscale time-resolved studies
- Integration of innovative deuterium labeling and high-performance computing for multiscale modeling

Cancer signaling pathways

Disorder mediates signaling that controls cell division

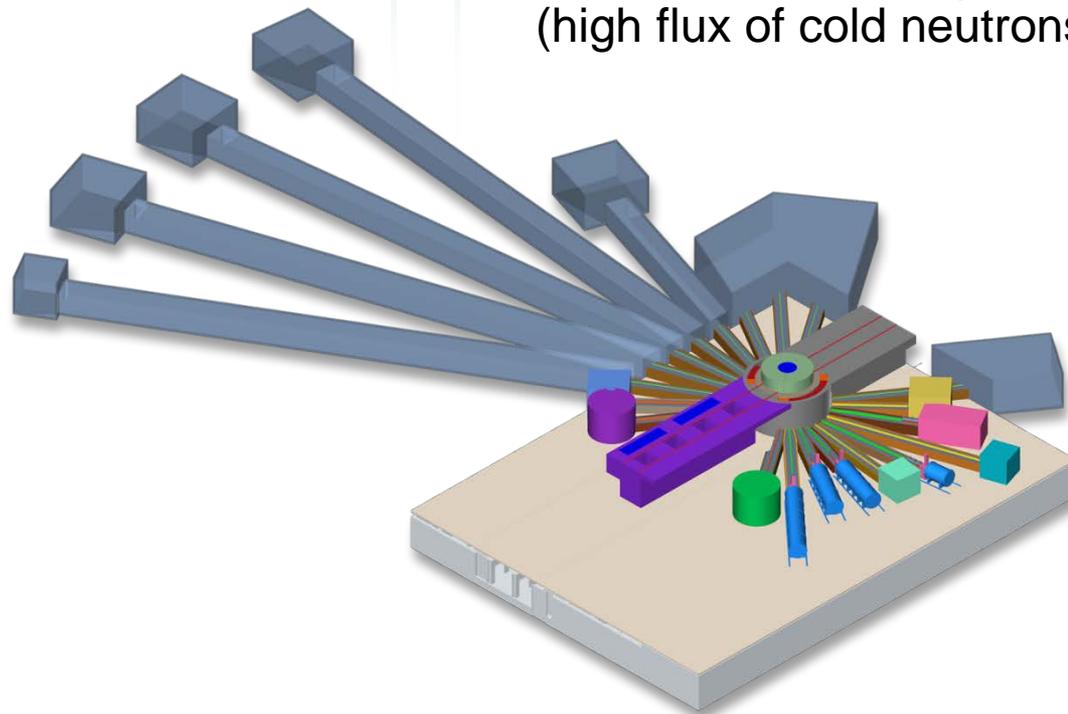

# Second Target Station (STS) is key to meeting future science objectives

## BESAC facility prioritization subcommittee, February 2013:

- “Absolutely central” to US leadership in science
- Presents “scientific and engineering challenges”

## STS: A short-pulse, long-wavelength spallation source

- 10 Hz (broadband source)
- 400–500 kW beam power (high flux of cold neutrons)

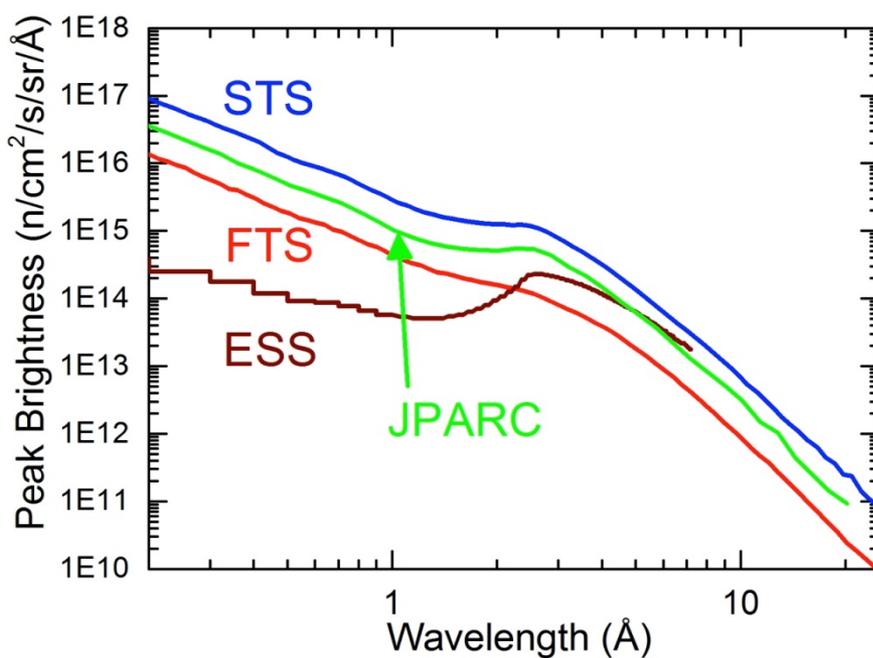

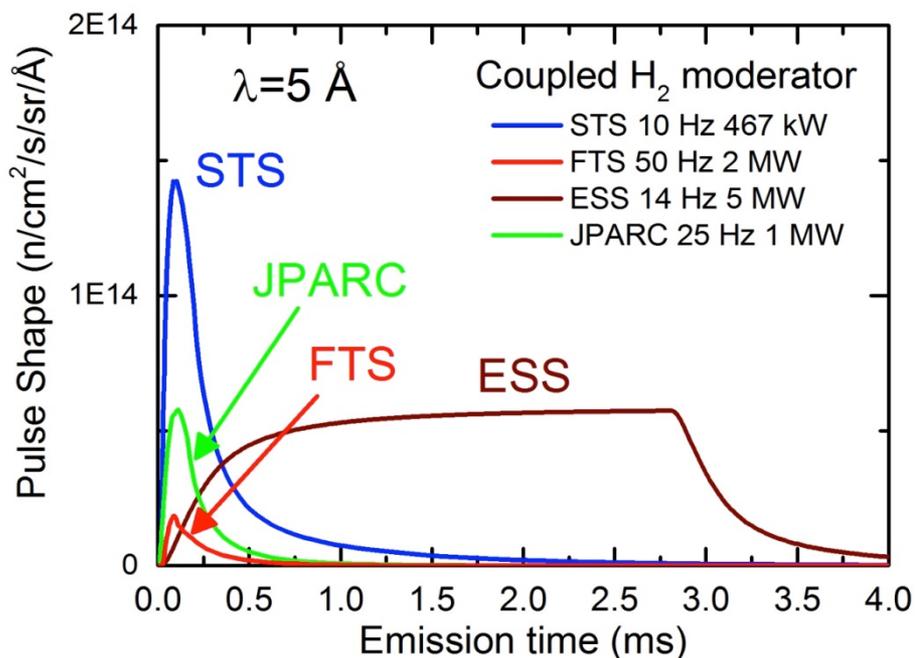

# STS will ensure US leadership in neutron sciences

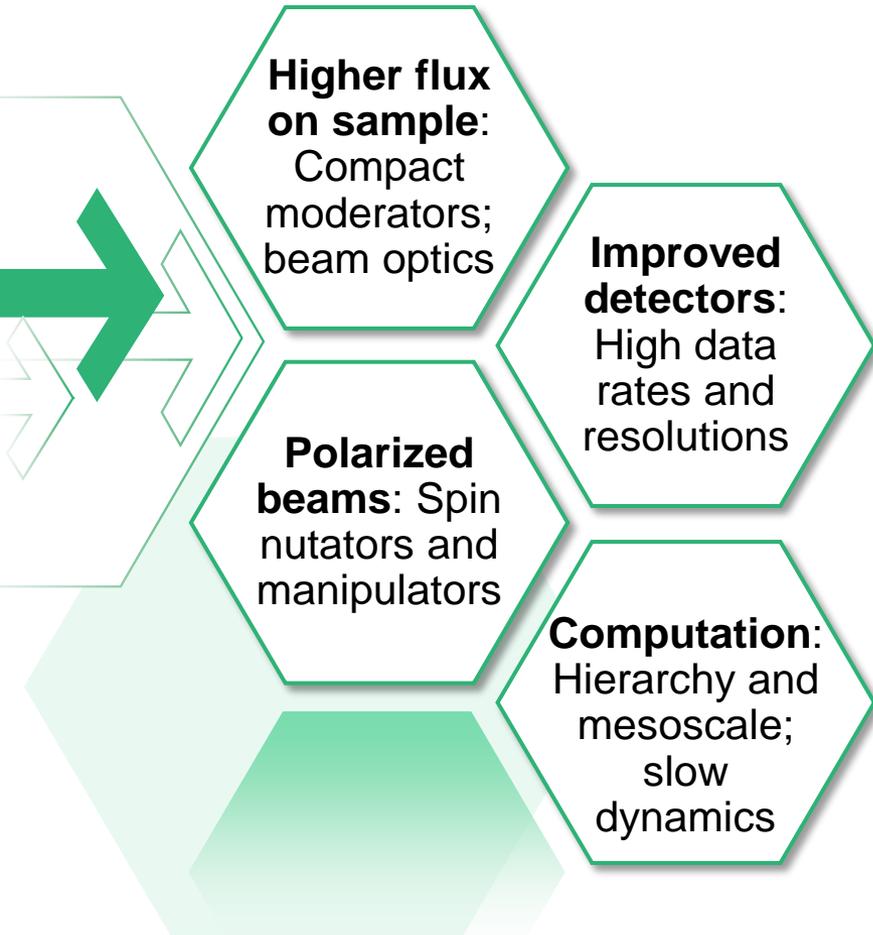

Short pulse provides highest peak brightness of any current or envisioned source

Long-wavelength beams are optimized for high brightness

Low repetition rate provides largest range of accessible wavelengths (length scales)

# Optimization of instruments from target to sample will enable groundbreaking STS instruments

## Instrument concepts

- Cold neutron chopper spectrometer: 200× gain
  - Inelastic neutron scattering (INS) under pressure to 100 GPa
  - Excitations in heterostructures, thin films
  - Polarized INS over full  $S_{\alpha\beta}(Q, \omega)$
- Reflectometry: 100× gain
  - Kinetics in membranes/bio systems
  - Off-specular: Lateral membrane structures/magnetic domains

# Complementarity across 3 ORNL neutron sources provides unrivaled capabilities

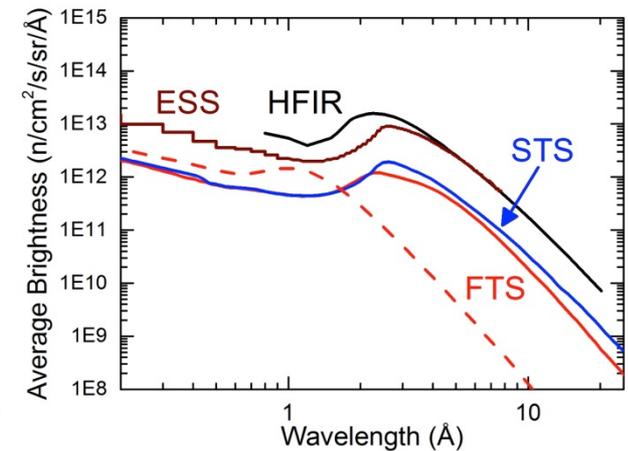

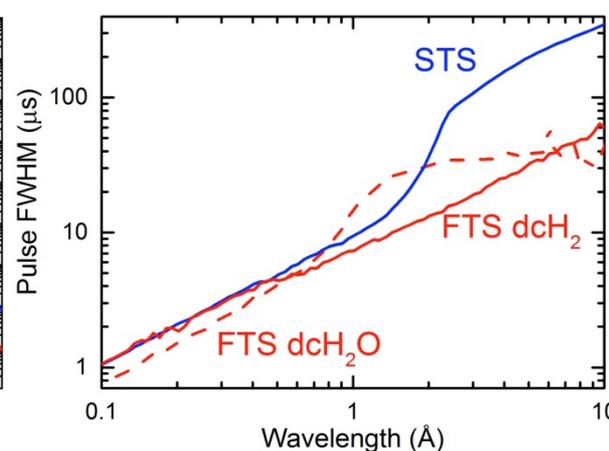

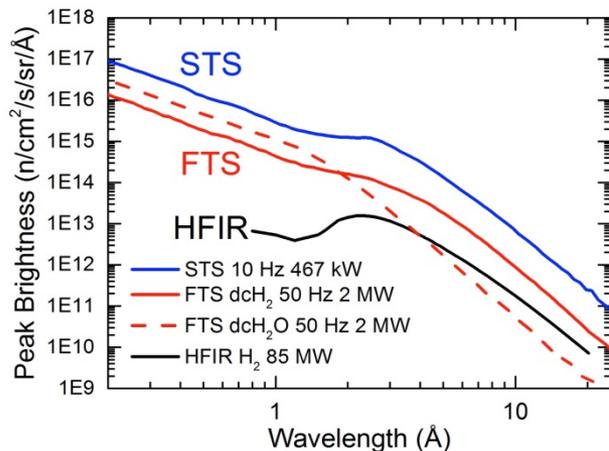

“Together, these three facilities can and will support the most potent and complete range of neutron beam facilities available in the world, now and in the foreseeable future.”

ORNL Neutron Advisory Board, 2013

**STS:** Optimized for cold neutrons with high peak brightness

**FTS:** Optimized for thermal and epithermal neutrons with high wavelength resolution

**HFIR:** Optimized for cold and thermal neutrons with high time-averaged brightness

# Discussion
