MISSION: To develop the fundamental molecular basis for solar-driven water oxidation and carbon dioxide reduction catalysis

RESEARCH PLAN

The AMPED EFRC will focus on molecular approaches to dye-sensitized synthesis of solar fuels, with an emphasis on the fundamental energy science underpinning photocatalytically active materials. A variety of individual photoelectrode architectures are being mechanistically examined using diverse solution and surface characterization techniques to provide an unparalleled depth in understanding of light-driven chemistry at material–molecule–electrolyte interfaces.
