

Kawtar Hafidi is an experimental nuclear physicist in Argonne National Laboratory's Physics Division and the Associate Chief Scientist of Laboratory Directed Research and Development. Her research involves experimental studies of quantum chromo-dynamics in the strong non-perturbative regime, with emphasis on spin structure, hadron formation; 3D imaging of nucleons and nuclei; nuclear modification effects; and tests of charge symmetry violation. She has been active in the American Physical Society as the chair of the Committee on Status of Women in Physics (2012). She had recently completed a detail assignment to the U.S. Department of Energy, Office of Science, Office of Nuclear Physics, Facility and Projects Division (2014). Kawtar Hafidi is a co-author of more than 140 peer-reviewed papers. She received her Ph.D in Nuclear Physics from the University of Paris XI in France in 1999, and was a postdoctoral fellow at Argonne National Laboratory prior to joining the Argonne National Laboratory staff in 2002.
